

THE COMPANY

Founded in 1966 in Beinasco by Ettore Vianello, VEP Automation has developed its own range of pneumatic components for the industrial automation sector.

In the early Seventies VEP – Vianello Ettore Pneumatica – decided to focus on two different product lines: nitrogen gas springs for sheet-metal pressing, components first manufactured in Europe by VEP, and pneumatic blockers and devices for use on welding lines.

Today the development of these two product families is the hallmark of the company, which offers a comprehensive catalogue addressing specific market requirements.

Experience accumulated in over 40 years, consolidated as a partner of the FIAT Group, for whom VEP has always been the benchmark in its field, strengths we can rely on to tackle a continually evolving and expanding market.

From 1996 all phases in the production process have been governed by a Quality Control System in conformity with ISO 9001 international standards
